Lecture 03 Class Activity – Conditionals, Booleans, Iteration

1. Given that a = 8, b = 17, c = 21, determine whether the following Boolean expressions are **True** or **False**.

   a) `not(a * 3 >= c) or "hi" >= "High"`

   b) `b + c > a + b and "Ann" >= "Anna"`

   c) `c - a >= b - a or a + 1 != c - 4 and b * 2 == a + c`

2. Determine the output of the following code if a value of 7 is input. You do not need to show the user prompt.

```
a = int(input("Enter an integer: "))
b = 6
c = -1

if a + c > b:
   a = a + 2
elif a + c < b:
   a = a - 2
elif a + c == b:
   a = a + b
else:
   a = a - b
b = b % 5 * 4
c = float(c) + 10
print(a)
print(b, 'c')
print(c)
```

3. Determine the output of the following code:

```
for x in range(0,100,10):
    if x % 3:
        x *= 100
    print(x, end = ' ')
```
